

# Towards the transient orientation of linear molecules

Thibault Vogt

October, 15 2007

# History : alignment and orientation in dilute gases

## ■ Static fields

- Quadrupole field and Hexapole field focusing : Stark effect used to select a rotational state  $|J, M_J\rangle$  of a molecule from a thermal mixture of rotational states

Diatomic molecules : *Zeitschrift für Physics*, 141 : 6 (1955)

Symmetric top molecules : *JCP*, 42 : 767 (1965)

- Brute Force orientation : strong static electric field to orientate molecules with a big dipole moment

*JCP*, 93 : 4779 (1990)

## ■ Laser fields

- Adiabatic alignment : intense laser electric field, pulse whose duration is much longer than the rotational period of the molecule

*JCP*, 104 : 3 (1996)

- Diabatic alignment : femtosecond laser electric field pulse, duration smaller than the rotational period of the molecule, field-free alignment

*Phys. Rev. Let.* 87 : 15 (2001)

- Transient Orientation ?

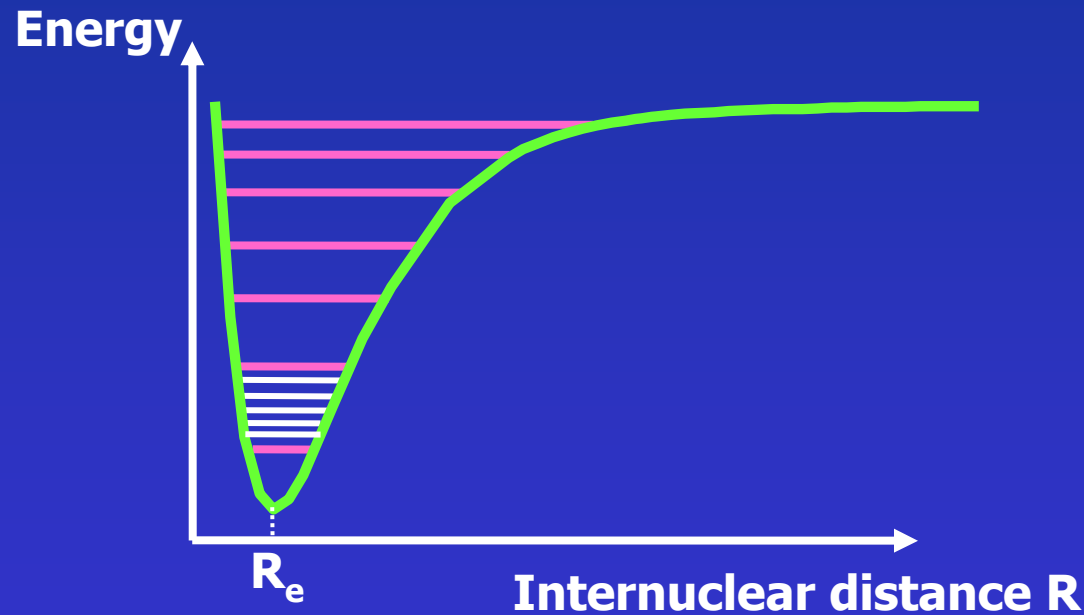

# Outline

- Orientation with static fields  
Orientation and alignment with laser fields  
⇒ femtochemistry, interferometry, quantum information, attosecond pulses...
- Transient Orientation of linear molecules
  - Computations
  - Half-cycle pulses
  - Asymmetric femtosecond pulses
  - Perspectives, status of the AMO experiments

# Orientation/Alignment : signification

$$W_s = W_{el} + W_{vib} + W_{rot}$$

$$|\Psi_s\rangle = |\Psi_{el}\rangle |\Psi_{vib}\rangle |\Psi_{rot}\rangle$$

**Orientation :**

$$\vec{R} \cdot \vec{u}_z \propto R_e \cos \theta$$

**Alignment :**

$$|\vec{R} \cdot \vec{u}_z|^2 \propto R_e^2 \cos^2 \theta$$

**For singlet molecules ( $\Lambda=0$ )**

$$\Psi_{rot} = \langle \vec{R} | J, M \rangle = Y_J^M(\theta, \varphi) \quad W_{rot} = B J(J+1)$$

# State selection

Graph of the Stark energy change  $W_{|J,M\rangle}(E^2)$

$$\vec{F} = -\overrightarrow{\text{grad}}(W_{|J,M\rangle})$$

$$|J,M\rangle = |20,0\rangle$$

$$|J,M\rangle = |0,0\rangle$$

# Hexapole focusing

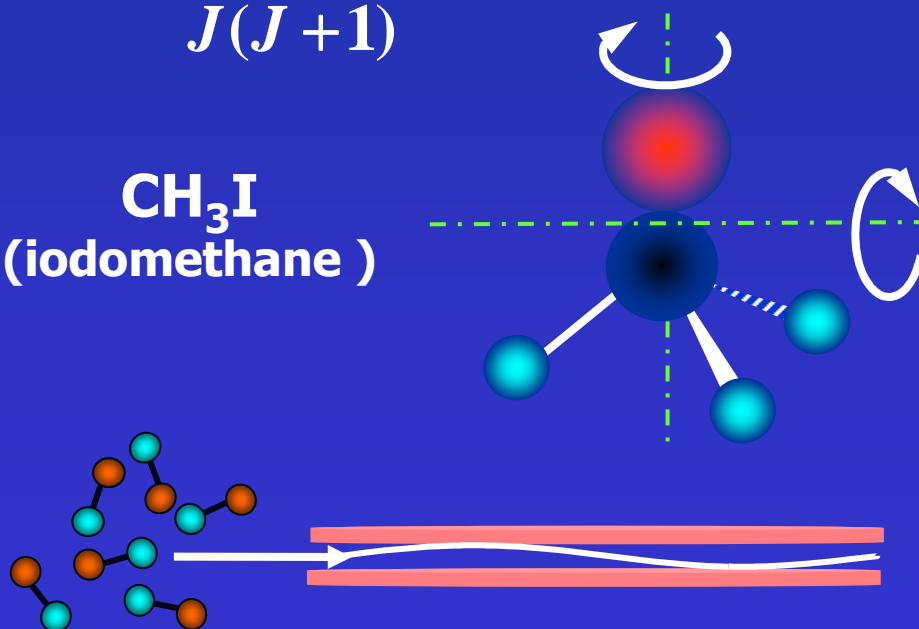

Used for symmetric top molecules

$$|\Psi_s\rangle \propto |J, K, M\rangle$$

$$\vec{F} \propto \frac{KM}{J(J+1)} \vec{r}$$

CH3I  
(iodomethane)

# Brute force orientation

Interaction energy of a polar molecule with a strong static electric field

$$= - \vec{\mu} \cdot \vec{E}_s = - \mu_0 E_s \cos \theta$$

Classical picture : torque exerted on the molecule, alignment of the permanent dipole moment on the field

Possibility with symmetric top molecules, but also singlet molecules  
Necessity of a very strong static field. Example : KCl,  $\mu_0 = 10.27$  D,  $E_s \sim 30$  kV/cm  
Also very small temperatures (supersonic molecular beams)

Supersonic jet : rotational cooling

$$P(|J, M\rangle) = e^{-BJ(J+1)/(kT)}$$

# Stereodynamics studies

**Studies on the steric effect (modification of reactions depending on the geometry and the presence of different chemical groups in molecules)**

**Collisional studies, head versus tail preferential reactions**

**Preferential reaction**

# Laser induced alignment

Strong static field replaced by a strong non-resonant laser field

$$H_{eff} = -\frac{1}{2} \sum_{i,j=x,y,z} \alpha_{ij} E_i E_j$$

$$H_{eff} = -\frac{1}{4} (\alpha_{||} - \alpha_{\perp}) \cos^2 \theta E_0^2$$

$\Delta\alpha = 6$  for  $N_2$

# Adiabatic alignment

## Condition of adiabaticity

$$\nu_{rot}(J) = \frac{B J(J+1)}{h}$$

$$T_p \ll T_{rot}(1) = \frac{1}{\nu_{rot}(1)} = \frac{\pi \hbar}{B}$$

## Pendular states observation for symmetric top molecules

*J. Chem. Phys.* **104** : 3 (1996)

« Adiabatic » orientation :  
Strong laser field + static field

$$H_{eff} = -\vec{\mu}_0 \cdot \vec{E}_S - \frac{1}{4}(\alpha_{\perp} - \alpha_{\parallel}) \cos^2 \theta E_0^2 - \frac{1}{4} \alpha_{\parallel} E_0^2$$

*Phys. Rev. Let.* , 90 : 083001 (2003)

# CO ionization

*D. Normand et al., J. Phys. B: At. Mol. Opt. Phys. 25, L497 (1992)*

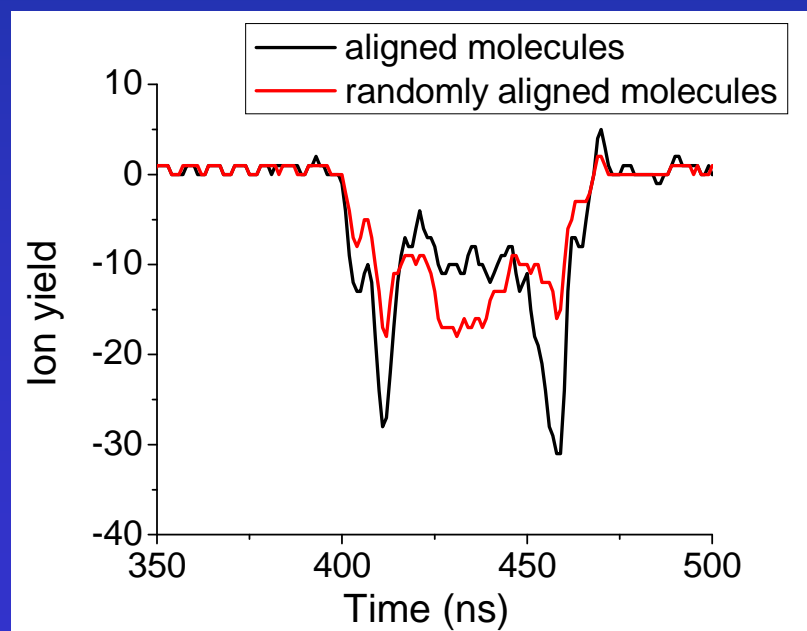

Decay path	Energy released (eV)	Branching ratio (%)
(1) $CO^{+} \rightarrow C^{+} + O$	1.2	11
(2) $CO^{+} \rightarrow C + O^{+}$	2	15
(3) $CO^{2+} \rightarrow C^{+} + O^{+}$	6	24
(4) $CO^{3+} \rightarrow C^{2+} + O^{+}$	10	39
(5) $CO^{3+} \rightarrow C^{+} + O^{2+}$	11	8
(6) $CO^{4+} \rightarrow C^{2+} + O^{2+}$	20	3

# Experimental observation : TOF spectroscopy

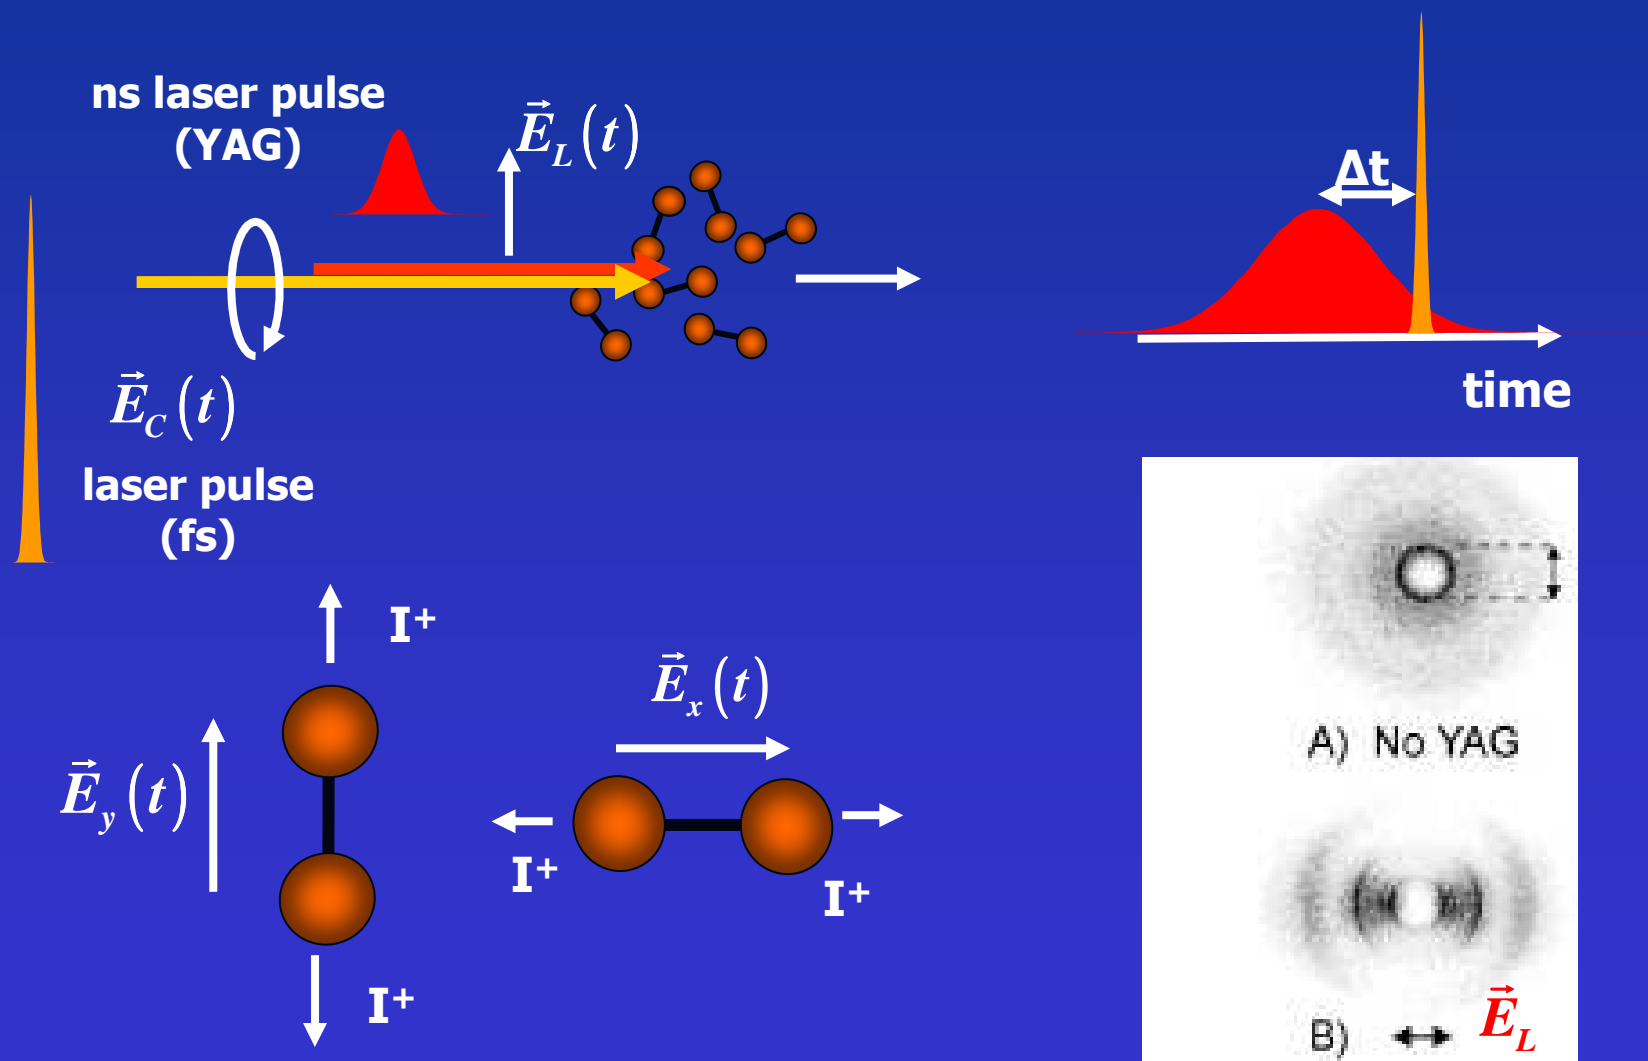

# Detection ( $\text{N}_2$ )

# Adiabatic alignment of Diiodine ( $I_2$ )

*JCP, 110 : 10235 (1999)*

# Diabatic alignment

$$H_{eff} = \frac{1}{4}(\alpha_{\perp} - \alpha_{\parallel}) \cos^2 \theta E_0^2 - \frac{1}{4} \alpha_{\perp} E_0^2$$

Short Pulse  $\rightarrow$  Impulsive Angular Kick

$$\frac{d\vec{p}}{dt} \propto -\sin 2\theta E_0^2 \vec{u}_{\theta}$$

Raman excitation of  
rotationnal states

$$W_J = B J(J+1)$$

$$|J_0, M_0\rangle \Rightarrow \Psi(t) = \sum_{J, M} c_J e^{-\frac{W_J t}{\hbar}} |J, M\rangle$$

Wavepacket excitation : revivals

$$\nu_J = k(J) \frac{2B}{h} \Rightarrow \tau_R = \frac{\pi \hbar}{B}$$

# Diabatic alignment

*Phys. Rev. Let., 87 : 153902 (2001)*

$$\text{Ratio} = \frac{A_2 - A_1}{A_1 + A_2}$$

# Diabatic alignment

$N_2$ ,  $I = 5 \times 10^{13} \text{ W/cm}^2$ , 50 fsec,  $T=10 \text{ K}$

Non-Zero Temperature:  $P_{|J,M\rangle} \sim \exp [-J(J+1)B/k_B T]$   
At high  $T$ , high Bohr frequencies, Centrifugal distortion  
→ Reduced Net Alignment

# Applications

**Preferential dissociation, Fragments selection**

**Control : pulse shaping**

**3D alignment**

**Lithography : Focusing and orienting molecules**

**Orientation of molecules and quantum information processing**

**Rotational temperature measurement**

**Attosecond pulses, rescattering experiments**

**Tomographic imaging of molecular orbitals**

# Orientation of molecules and quantum information processing

Stark addressing of individual trapped polar oriented molecules (qubit), interaction between the qubits driven by the dipole-dipole interaction

# Rotational temperature analysis

*Phys. Rev. A* **68** : 023406 (2003)

## Fourier analysis

Amplitude of the states  
after excitation

$$P(|J, M\rangle) = S(J) e^{-BJ(J+1)/(kT)}$$

# Attosecond pulses, rescattering experiments

**Attosecond pulses from High Harmonic generation**  
*Science, 292 : 1689 (2001)*

**Symmetry properties  $\Rightarrow$  odd harmonics for atoms**  
**Even harmonics for non centrosymmetric molecules**

# Tomographic imaging of molecular orbitals

*Nature*, 432 : 867 (2004)

**Reconstructed of N<sub>2</sub> in its ground state HOMO (highest occupied molecular orbital)**  
**Experimental HHG (High Harmonic generation) spectrum (dependence with alignment)**

## Intermediate conclusion

- Orientation in a static field
  - Adiabatic alignment
  - Diabatic (field-free) alignment
- 
- Field-free orientation

# Theory

## Interaction energy of a molecule with an electric field

$$\begin{aligned}
 H &= H^{(0)} + V \\
 &= H^{(0)} - \vec{\mu} \cdot \vec{E} - \sum_{\alpha, \beta=x,y,z} \frac{1}{3} \Theta_{\alpha\beta} \frac{\partial E_{\beta}}{\partial \alpha} - \vec{m} \cdot \vec{H} - \dots
 \end{aligned}$$

**Dipolar moment  
operator**

$$\vec{\mu} = \sum_i e_i \vec{r}_i = \sum_{\alpha=x,y,z} \mu_{\alpha} = \sum_{\alpha} \sum_i e_i r_{i\alpha}$$

**Quadrupolar moment operator**

$$\Theta_{\alpha\beta} = \frac{1}{2} \sum_i e_i (3r_{i\alpha} r_{i\beta} - r_i^2 \delta_{\alpha\beta})$$

**Dipolar approximation : size of the molecule  $\ll \lambda$**

# Theory

## Interaction energy of a molecule with a static electric field

$$H = H^{(0)} - \vec{\mu} \cdot \vec{E} \quad \vec{\mu} = \sum_{i=x,y,z} \mu_i = \sum_i \sum_n e_n \mathbf{r}_{n_i}$$

Result from the perturbation theory, for a given state  $\Psi$  :

$$W = \langle \Psi | H | \Psi \rangle = W^{(0)} - \mu_i^{(0)} E_i - \frac{1}{2} \alpha_{ij} E_i E_j - \frac{1}{6} \beta_{ijk} E_i E_j E_k - \dots$$

Linear Polarisability :  $\alpha_{ij}$

Diatomic molecules :

$$-\frac{1}{2} \alpha_{||} E_{||}^2 - \frac{1}{2} \alpha_{\perp} E_{\perp}^2$$

First Hyperpolarisability  $\beta_{ijk}$

## Interaction energy of a molecule with a periodic electric field

$$H = H^{(0)} - \vec{\mu} \cdot \vec{E}(t) \qquad \vec{\mu} = \sum_{i=x,y,z} \mu_i = \sum_i \sum_n e_n \mathbf{r}_{n_i}$$

$$W = \langle \Psi | H | \Psi \rangle = W^{(0)} - \overline{\mu_i^{(0)} E_i} - \frac{1}{2} \overline{\alpha_{ij} E_i E_j} - \frac{1}{6} \overline{\beta_{ijk} E_i E_j E_k} - \dots$$

**“Explanation” : Floquet theorem  $\Rightarrow$  wavefunction expanded in Fourier series**

$$\Psi_s = e^{(-iW_s t/\hbar)} \sum_{n=-\infty}^{\infty} C_n e^{(-in\omega t)} \qquad \text{sum of wavefunctions} \qquad C_n e^{(-i(\frac{W_s}{\hbar} + n\omega)t)}$$

with  $W_s = \overline{\langle \Psi_s | -\vec{\mu} \cdot \vec{E} | \Psi_s \rangle}$   $W'_s = W_s + n\hbar\omega$

**Very weak interaction  $\Rightarrow C_0$  only non negligible term  $\Rightarrow$  Possibility to define one energy**

$$W'_s = W_s \qquad \Psi_s = e^{(-iW_s t/\hbar)} \Phi_s = e^{(-iW_s t/\hbar)} C_0$$

**Time independent Schrodinger equation, possibility to apply time independent perturbation theory to these wavefunctions**

# Field-free orientation of molecules

Interaction energy of a molecule with one periodic electric field

$$H_{eff} = H^{(0)} - \underbrace{\overline{\mu_{0i} E_i}}_{=0} - \frac{1}{2} \overline{\alpha_{ij} E_i E_j} - \frac{1}{6} \underbrace{\overline{\beta_{ijk} E_i E_j E_k}}_{=0} - \dots$$

⇒ Asymmetric electric field necessary **2 possibilities :**

**“Half-Cycle Pulse”  
(HCP)**

# Computations

- 1) Semi-analytical solutions : impulsive limit
- 2) Numerical solutions of the TDSE (Time dependent Schrodinger equation)

$$i\hbar \frac{\partial \Psi(t)}{\partial t} = H(t) \Psi(t)$$

**Resolution in the basis of the rotational states**

$$\begin{array}{l} \text{Initially } |J, M\rangle \\ P(|J, M\rangle) = e^{-BJ(J+1)/(kT)} \end{array} \Rightarrow \begin{array}{l} |\Psi(t)\rangle = \sum c_{J', M'}(t) |J', M'\rangle \\ i\hbar \dot{c}_{J', M'} = \sum_{J'', M''} c_{J'', M''} \langle J', M' | H(t) | J'', M'' \rangle \end{array}$$

# Impulsive limit

$$\Psi(t) = U(t_0, t) \Psi(t_0)$$

$$H = H_0 \Rightarrow U(t, t_0) = e^{-i H_0 (t-t_0) / \hbar}$$

$$U(t, t_0) = e^{-i/\hbar \int_{t_0}^t H_0 dt'}$$

**Impulsive limit approximation : case of a time-dependent Hamiltonian**

$$U(t, t_0) \approx e^{-i/\hbar \int_{t_0}^t H(t') dt'}$$

Our case :  $T_p \ll T_{rot} = \frac{\pi \hbar}{B}$

Our case : equivalent to neglect the rotation of the molecules during the interaction

**Momentum kick**

$$U(t, t_0) \approx e^{-i/\hbar \left( -\mu_0 \cos \theta \int_{t_0}^t E(t') dt' - \frac{\Delta \alpha}{2} \cos^2 \theta \int_{t_0}^t E^2(t') dt' + \dots \right)}$$

# Transient Field-Free Orientation of Polar Molecules

## Half-Cycle Pulse

$$H(t) = -\mu_0 E(t) \cos\theta$$

HBr  $T = 2\text{K}$

# HCP generation

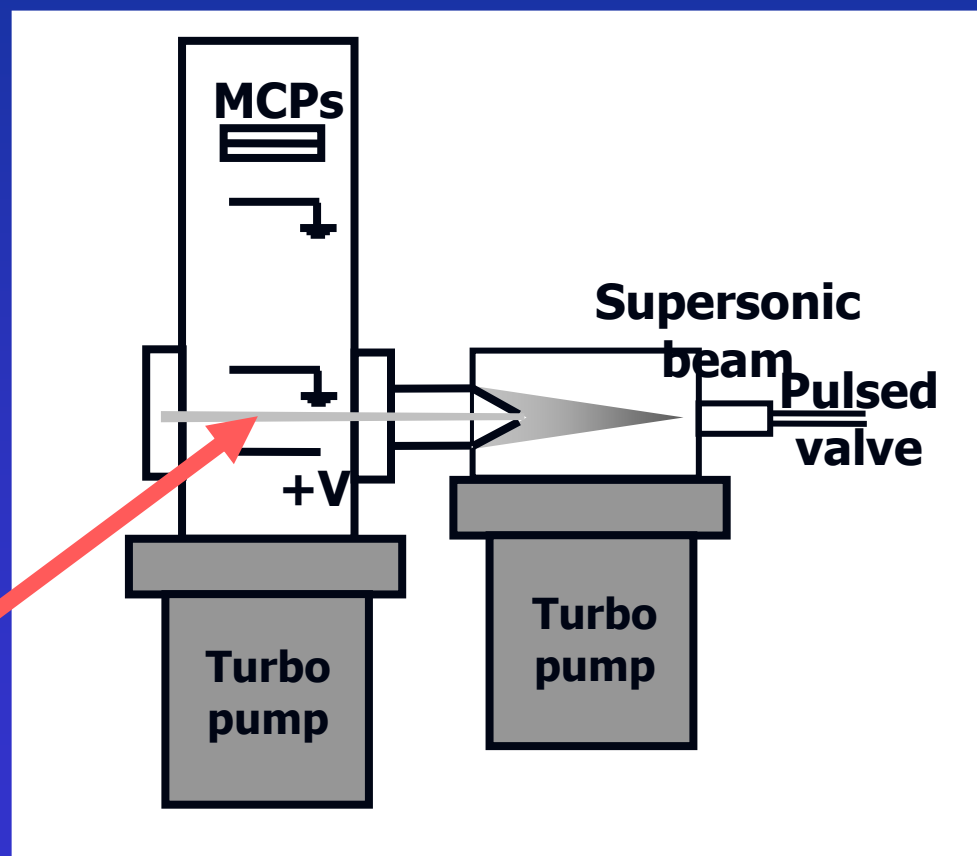

# Experiment

Ex :  
Hydrogen Bromide (HBr)  
 $\mu_0 \approx 0.8$  D

Lasers (780 nm)  
HCP

## Difficulties

- Synchronization (delay stage)
- Space overlap
- Stabilization (intensities, chirp)
- Calibration of an intense HCP
- Temperature

# Alignment : N<sub>2</sub>

$$\text{Ratio} = \frac{N_2 - N_1}{N_1 + N_2}$$

## Alignment : HBr

$\Delta\alpha \approx 1.5$  (a. u.) and  $T_r \approx 15$  K

**Strong dependence of the degree of orientation with the temperature : we hope to get better !**

# Orientation with two overlapping femtosecond pulses

$$E(t) \propto \cos(\omega t) + \cos(2\omega t)$$

⇒ *Even and odd J states population necessary*

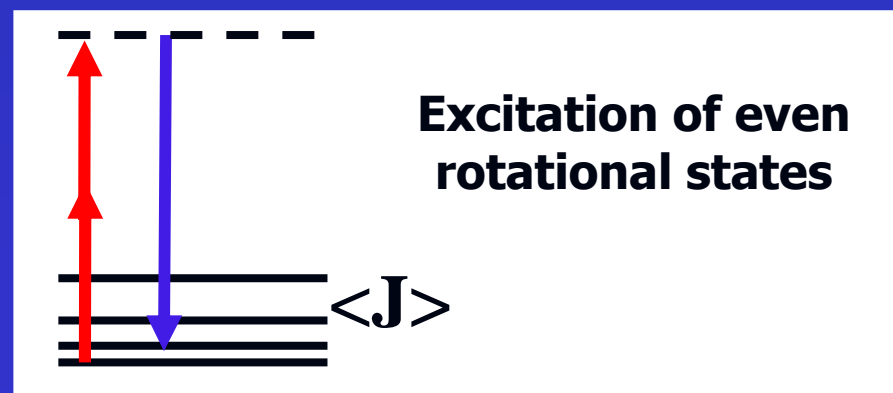

$$|\Psi(-\vec{R})|^2 \neq |\Psi(\vec{R})|^2$$

**Promising : possibility to orientate molecules without the need of any dipole moment**

**Ex :**

**Carbon monoxide (CO)**

$$\mu_0 \approx 0.12 \text{ D}$$

# Orientation with two overlapping femtosecond pulses

$$H_{eff} = \frac{1}{2} \overline{\alpha_{ij} E_i E_j} - \frac{1}{6} \overline{\beta_{ijk} E_i E_j E_k}$$

$$H_{eff} = -\frac{1}{4} (E_\omega^2 + E_{2\omega}^2) (\Delta\alpha \cos^2 \theta) - \frac{1}{12} E_\omega^2 E_{2\omega} (\Delta\beta \cos^3 \theta + \beta_\perp \cos \theta)$$

$$\Delta\beta = \beta_{||} - \beta_\perp$$

$$\frac{\beta_\perp}{3} = \beta_{xxz} = \beta_{xzx} = \beta_{zxx} = \beta_{yyz} = \beta_{yzy} = \beta_{zyy}$$

$$\beta_{||} = \beta_{zzz}$$

**Experimental difficulty : Problems of ionization**

**Other problem :**

**Strong alignment of the molecules (orientation messed up by the alignment)**

**Possibility to try HBr (polarisability anisotropy 3 times smaller than for CO)**

# Computations : CO

**$I = 2.2 \cdot 10^{14} \text{ W/cm}^2$  in both pump beams**

**Without alignment**

**With alignment**

# Computations

CO

HBr

**Very low temperatures necessary !**

# Conclusion

- Orientation of molecules with electric fields

Stereodynamics studies, fragments selection...

but not yet field-free oriented molecules

Important for recollision experiments, tomographic imaging

- Experimental difficulties with the two overlapping femtosecond pulses (temperature, alignment...)
- Half-cycle pulse ?
